SUMMARY

Software engineer with more than two years at Verizon, building Java 17 and Spring Boot services and REST and GraphQL APIs, and moving legacy monoliths onto reactive microservices. I work across the stack in React and TypeScript, and build the team's Python and FastAPI tooling for applied GenAI: most recently a code knowledge graph and MCP server that cut dependency-analysis lookups from about 60 seconds to under 5. I rely on SOLID design, secure coding and automated tests.

EXPERIENCE

Engineer I, Software Development, Verizon

Jul 2024 – present · Chennai

- **Approval-API framework.** Designed a reusable approval-API framework for line suspend and resume, cost-centre changes and related request types, used by another product team, and built the React front-end flows on top. Four flows shipped to production in August 2026.
- **Legacy migration.** Migrated five legacy APIs out of distributed monoliths into cloud-ready reactive microservices (Spring Boot, Spring Reactive, GraphQL) and delivered more than five Spring Boot REST APIs, using SOLID and dependency injection to keep them extensible.
- **GraphQL schema.** Extended the GraphQL schema layer with types and queries across the migrated services, agreeing field and table needs with the data platform team.
- **Service monitoring.** Built the front end of an internal service-status monitoring tool, organising dense status data into dropdowns, nested tables and utility actions with hand-written CSS.
- **Code knowledge graph and MCP server.** Built a code knowledge graph and a local stdio MCP server over a Spring Boot codebase of more than 700 files, indexing class declarations, annotations and package structure for symbol-usage and downstream dependency-impact queries. Lookups that took about 60 seconds of manual search now take under 5.
- **Production fixes.** Troubleshot and resolved Java 17 production blockers and routing defects in customer and sales-agent journeys, tracing root causes through dependent systems.
- **Release notes, automated.** Automated release documentation with a generator that reads GitLab commits and Jira, removing a manual write-up from every release; adopted by principal architects.
- **Team practice.** Use GitHub Copilot, Gemini and Cursor in daily engineering work; mentored the 2025 intern batch.

Prototypes and proofs of concept

- An OCR pipeline to digitise manual gas-sheet entry.
- A context-aware outbound voice bot on Twilio and Gemini.
- JSONL-driven modules that generate user interfaces dynamically, as part of MCP proof-of-concept work.
- A lead-scoring proof of concept: a Restricted Boltzmann Machine over unlabelled lead data, ranking which leads to approach next.

Student Intern, Verizon

Feb 2024 – Jul 2024 · Chennai

- **Homepage redesign.** Rebuilt the global navigation and search components in React for Verizon's homepage redesign.
- **Presentation.** Presented the working prototype and its architecture to senior onshore and offshore leadership; the presentation secured project funding and approval for QA deployment.

PROJECTS

syllabus-agent

Personal project · Python, FastAPI, asyncio, MongoDB

GitHub github.com/Achchutan-S/searchtosyllabi

A six-stage asynchronous pipeline that turns a subject into one canonical syllabus.

- Classifies the subject, searches the web and extracts syllabi from HTML, PDF and scanned sources (BeautifulSoup, PyMuPDF, Tesseract OCR); keeps what an LLM judges relevant and merges the most trusted sources.
- LLM, search and cache clients behind provider-agnostic interfaces; MongoDB caching; SSRF-guarded fetching; per-call JSONL tracing with secrets redacted; 101 tests.

Dev X-Ray

Personal project · React 18, TypeScript, Vite, Zustand, Monaco

Live devxray-one.vercel.app · GitHub github.com/Achchutan-S/devxray

A privacy-first toolkit of 24 developer tools that runs in the browser with no backend or telemetry, and installs as an offline PWA.

- JSON parsing and regex execution run in Web Workers; JWTs are verified with Web Crypto using a caller-chosen algorithm, which prevents algorithm confusion.
- The GraphQL engine is a standalone workspace package; routes are prerendered for search engines.

Exam Helper

Personal project · Python, FastAPI, React, MongoDB, Gemini

GitHub github.com/Achchutan-S/let-me-study

Turns exam screenshots into a searchable question bank.

- OCR with pytesseract, and red-ink answer-key detection with OpenCV; explanations and automatic tags generated with Gemini.
- Embeddings for semantic search over the questions; filtered PDF export.

Orrery

Personal project · Astro, TypeScript, React, Hono, Playwright

Live orrery-teal.vercel.app · GitHub github.com/Achchutan-S/orrery

This site: a platform for independent experiences, each with its own design, on one static Astro site.

- A typed release model decides what each environment builds; build-time checks for leaks, budgets and import boundaries; a strict Content Security Policy; browser tests with Playwright and axe; a local Control Center for releases.

Earlier machine-learning work: a hybrid CNN and RNN/LSTM brain-tumour classifier, an academic deep-learning project (6th semester) that improved reported classification accuracy from 82% to 89% during experimentation; not clinically validated. Also unsupervised SOM and ANN credit-card fraud detection.

SKILLS

Backend and systems: Java 17 · Spring Boot · Spring Reactive · Python · FastAPI · Node.js · REST API design · GraphQL · Microservices · Reactive systems · asyncio

Front end: React · TypeScript · JavaScript · Vite · Zustand · PWA · Web Workers · HTML · CSS

AI and GenAI: LLM API integration and provider abstraction · MCP server development · Prompt engineering · Embeddings and semantic search · OCR pipelines · Deep learning fundamentals (CNN, RNN/LSTM, SOM, ANN)

Databases: MySQL · MongoDB · Cassandra · JDBC

Design and quality: OOP · SOLID · DRY · Dependency injection · Design patterns · JUnit · Mockito · pytest · Vitest · SonarQube · Secure coding

DevOps and tooling: Git · GitLab CI/CD · Jenkins · Maven · Jira · Agile and Scrum · Swagger and OpenAPI

Exposure only: Docker · Kubernetes · Google Cloud Platform

EDUCATION

B.Tech, Computer Science & Engineering

SASTRA Deemed University, Thanjavur

Jun 2024 · CGPA 8.47

RECOGNITION AND LEARNING

Recognition:

GATE (Computer Science): qualified in 2024 and 2026.
2025 Q1 Spotlight Award, Verizon.
Cheers for Peers recognition, Verizon.

Certification:

Google Cloud Certified – Generative AI Leader (exam passed October 2026).

Courses and learning paths:

Google AI Essentials.
Google AI Professional Certificate.
Google Cloud Career Practitioners: Cloud Engineer learning path.
